Chemical Definition

Master stop anti-slip tape consists of uniform coat of abrasive grit, securely bonded to a polymer substrate with a flexible isocyanate/polyal emulsion in sufficient thickness to achieve optimum bond and grit exposure. The emulsion is UV blocked to resist color fade.

Adhesive

The underside has a uniform application of a permanent type, solvent based, acrylic emulsion pressure sensitive adhesive.

Release Liner

90# polycoated Kraft release paper (liner).

The release liner is coated on both sided with polyethylene for weather and moisture resistance and treated on the adhesive side with silicone to assure easy removal of the liner from the product.
